

Product Requirement Document

NRS Merchant Management Portal

Version 1.1

Prepared by

Public Sector Product Team

April, 2026

Document History

Version	Author	Action	Date
1.0	Bright Bassey	Created	Nov 25, 2025
1.1	Lovelyn Okpara	Updated	March 30, 2025

1. Introduction

a. Objective:

Develop a unified NRS Management Portal to centralize the management of NRS related services (e-invoicing and VAT automation), streamline merchant onboarding, provide analytics and reporting, and improve long-term continuity for all teams (Business, Operations, DevOps, and Tech Support).

b. Scope:

The portal will provide comprehensive support for VAT Automation and E-Invoicing activities, including role-based access, merchant onboarding to invoice transmission, integration credential handling, transaction tracking and real time analytics and reporting.

c. Stakeholders

Role	Responsibilities
DevOps	Manage merchant onboarding, credentials management, and integration tools, view audit logs
Business	Manage reports, merchant activity, and merchant performance.
Operations	Track and monitor VAT payments
Tech Support	Access to VAT payment logs, troubleshooting, PRN Validation
Tech Support Lead	PRN validation & VAT payment monitoring, view audit logs (admin access)
Software Engineering Lead	Oversee technical operations for VAT & E-Invoicing, view audit log, (super admin access)

2. Functional Requirements

1. User Authentication and Access Control

- a. support secure user authentication through a login screen where users will input their credentials (username/password).
- b. must support role-based access where different users have different permissions depending on their roles.
 - **Admin:** Full access to manage users, configure system settings, and review logs.
 - **Business Team:** Access to reports, merchant activity, and analytics.
 - **DevOps:** Access to manage onboarded merchants and credentials.
 - **Tech Support:** Access to VAT payment logs and troubleshooting.
 - **Operations:** Access to merchant status and performance metrics.

2. Overview/Dashboard

- a. **VAT Automation** - Focuses on all activities related to VAT processing, such as PRN validation, VAT payments, and reconciliation.

- **PRN Validation** - The system must validate PRN numbers for VAT payments, allowing users to check if a PRN exists and is valid for VAT processing.
 - **Error Handling:** The system must provide detailed error logs for failed VAT payments and failed PRN validations. Users should be able to trace errors for troubleshooting.
 - **VAT Payment Reporting:** The system should allow users to generate customizable reports for VAT payment history, including filtering by date, merchant, and payment status.
- b. **E-invoicing** - This section focuses on all activities related to E-Invoicing, tracking invoice statuses, merchant performance, and handling any invoice issues.
 - **Invoice Error Logs:** The system should maintain logs for failed invoices, capturing reasons for failure (e.g., missing data, validation errors) and provide actionable insights to fix them.
 - **Failed Invoice Alerts:** The system should notify relevant users if there is a high rate of failed invoices or recurring issues with specific merchants.
 - **Invoice Analytics:** The system should include features for analysing invoice data, showing metrics such as the number of invoices created, transmitted successfully, or failed. The system should offer customizable views for different time frames (e.g., daily, weekly, monthly).
 - **Merchant Performance Metrics:** The system should offer insights into merchant performance, including metrics like the number of invoices generated by each merchant, failure rates, and success rates.
- i. **Merchant Management**
 - a. **Merchant Onboarding:** The system must support completing onboarding of new merchants from IMS (Integrated Merchant Service) including assigning them specific privileges (e.g., System Integrator service, Access Point Provider service).
 - b. **Merchant Activity Tracking:** The system should allow users to track merchant activity in real-time, including invoice processing and VAT payment status.
- c. **User Management** - Manage user access and permissions, ensuring that only authorized users can access sensitive information.
 - **Create, Edit, and Deactivate Users:** Admins must be able to create, edit, and deactivate user accounts with the appropriate permissions and roles.

- **Permission Assignment:** The system must allow admins to assign custom permissions for different user roles (e.g., view-only, full access).
 - **User Activity Logs:** The system should maintain audit logs for user activities such as login attempts, role changes, and data access.
- d. **Analytics and Reporting** - Allow users to generate and review detailed reports related to VAT Automation and E-Invoicing activities - customizable reports, export options, scheduled reports.
 - **Custom Report Generation:** Users should be able to generate customized reports for both VAT and E-Invoicing processes, with the ability to filter by date, merchant, transaction type, and status.
 - **Export Reports:** Reports must be exportable in formats such as Excel, PDF, or CSV.
 - **Scheduled Reports:** Users should be able to schedule automated report generation and delivery (via email) on a recurring basis.
- e. **Settings** - Configure and customize system-wide settings, such as webhook configurations, integration settings, email and notification preferences.
- f. **Audit Logs** - Track all system activities for security and compliance.

3. Non-Functional Requirements

1. Performance:

- a. The system must be scalable to handle a growing number of merchants, transactions, and users simultaneously without performance degradation.
- b. The portal should have an average response time of under 2 seconds for user actions such as generating reports or validating PRNs.

2. Availability and Reliability:

- a. The portal should guarantee 99.9% system uptime (excluding scheduled maintenance).
- b. The system must implement automated daily backups of all data, including merchant profiles, invoice statuses, and transaction records. In case of failure, data recovery should be possible within an hour.

3. Security

- a. All sensitive data, such as user credentials, transaction details, and merchant information must be encrypted.
- b. User permissions must be managed through role-based access control (RBAC), ensuring that only authorized users can access specific data or perform certain actions (e.g., create/edit users, access sensitive transaction data).

4. Usability

- a. The system must have a user-friendly and intuitive UI that provides a seamless experience. Users should be able to easily navigate between the sections (VAT, E-Invoicing, Reports, Settings).

5. Compliance and Regulatory Requirements

- a. The portal should provide comprehensive audit trails of all critical actions (e.g., system configuration changes, user logins) for auditing and compliance purposes.

4. User Stories

Software Engineering Lead (Gbenga Akanbi)

1. Create and manage Admin Users

- As the Software Engineering Lead, I want to create and manage admin users so that the right people can access to portal.
 - **Acceptance Criteria**
 - Software Engineering Lead can create admin-level users.
 - Admin users must be assigned a role at creation.
 - Admin users can be activated or deactivated.
 - All admin user actions are recorded in the Audit Log.

2. Review Merchant Integration Privilege Assignments

- As the Software Engineering Lead, I want to review merchant integration privilege changes (e.g., Access Point, System Integrator) so that integrations remain accurate and compliant.
 - **Acceptance Criteria**
 - Software Engineering Lead can view all merchant integration privilege changes.

3. Access and Review Audit Logs

- As the Software Engineering Lead, I want full access to audit logs so that I can monitor compliance, investigate incidents, and ensure the portal is being used appropriately.
 - **Acceptance Criteria**
 - Full read-only access to all audit logs.
 - Ability to filter logs by:
 - User.
 - Action type.
 - Date range.
 - Entity (merchant, user, credential, webhook).
 - Audit logs are immutable (cannot be edited or deleted).

4. Oversee Technical Operations

- As the Head of Software Engineering, I want visibility into merchant onboarding, integration credentials, and system activity so that I can ensure platform stability and operational integrity.
 - **Acceptance Criteria**
 - Dashboard view showing:

- Total onboarded merchants.
- Integration credential activity (change, resend).
- Webhook configuration status.
- Ability to drill down into merchant-level technical details.
- Visibility is read-only (no direct modification of credentials or webhooks).

2. DevOps Team

1. Manage Client Credentials

- As DevOps, I want to be able to view and manage the client ID and client Secret for merchants, so that I can share integration details with them and ensure secure communication.
 - **Acceptance Criteria:**
 - A button to copy client ID and secret.
 - Only accessible by a member of the DevOps team.
 - Changes logged in the audit log.

2. Update Client Secret

- As DevOps, I want to regenerate/change a Client Secret for a merchant if it is compromised, so that the merchant can continue secure integration.
 - **Acceptance Criteria:**
 - Button available for DevOps to change the secret.
 - New credentials automatically emailed to the merchant.
 - Audit log captures old and new metadata (not the secret itself).

3. Assign Access Point/System Integrator Privileges

- As DevOps, I want to assign or modify merchant privileges (e.g., Access Point, System Integrator), so that merchants can integrate correctly.
 - **Acceptance Criteria:**
 - A dropdown for assigning privileges to merchants.
 - Changes are logged in the audit log.

4. Resend Credentials

- As DevOps, I want to resend integration credentials to merchants who claim not to have received them, so that they can continue their integration.
 - **Acceptance Criteria:**
 - A "Resend" button triggers the email with credentials.
 - Resend action is recorded in the audit log.

5. Manage System Users

- As DevOps, I want to create, edit, and manage system users so that only authorized personnel can access the portal.
 - **Acceptance Criteria**
 - Only DevOps and explicitly approved 'senior' roles can create new users.
 - A role must be assigned at the point of user creation.
 - Users can be activated or deactivated.

- All user creation, modification, and deactivation actions are recorded in the Audit Log.

6. Manage Merchant Webhook URLs

- As DevOps, I want an editable Webhook URL field for each merchant so that I can configure webhook integrations correctly after receiving the URL from the merchant.
 - **Acceptance Criteria**
 - Merchant table includes a Webhook URL column.
 - The Webhook URL field is editable only by DevOps users.
 - DevOps can add or update the webhook URL at any time.
 - The system validates that the entered value is a valid URL format before saving.
 - Every webhook update is recorded in the Audit Log, capturing:
 - Who updated it.
 - Old webhook URL.
 - New webhook URL.
 - Timestamp.
 - The saved Webhook URL is consumed by backend services to register or update the webhook for the merchant.

3. Tech Support Team

User Story 1- Manual Payment Gateway Transaction Notification

As a Tech Support Admin, I want to search for a transaction by PRN, Transaction Date and Bank Code and initiate a manual notification to NRS, so that payment gateway transactions missing from the NRS system are resolved promptly.

- **Pre-conditions / Pre-requisites**
 - User is authenticated and has Tech Support Admin role.
 - User has navigated to the VAT Automation menu.
 - System has read/write access to `firsd.db.payment_payload_request` and `firs_newdb.firs_transaction`.
 - Bank list is available and loaded from the `firs_bank` table.
 - Stored Procedure 'Notify_Manual_Payment' is deployed and accessible.

Acceptance Criteria

AC1 — Search Form

- Search form provides three fields: PRN (free text), Transaction Date (date picker), Bank Code (dropdown loaded from `firs_bank` table).
- All three fields are required before submission.
- The search button should be "Get Transaction Details"
- Submitting the form triggers a lookup against `firsd.db.payment_payload_request` and `firs_newdb.firs_transaction`.

AC2 — Existing PRN Check

- If the PRN already exists in `firs_newdb.firs_transaction`, the system displays the message: "Transaction already notified" and stops processing.

- No notification query is executed for existing PRNs.

AC3 — Transaction Display

- If the PRN does not exist in `firs_newdb.firs_transaction`, the system fetches and displays the transaction record with the following columns:
- `payment_code`, `amount`, `bank_name`, `description`, `payment_status`, `notified_status`, `trnx_ref`, `channel`, `payment_type`, `response_message`, `Created Date/Time`, `Initiated By`
- A 'Proceed to Notify NRS' button is displayed below the transaction record.

AC4 — Notification Execution

- Clicking 'Proceed to Notify NRS' triggers execution of the Stored Procedure 'Notify_Manual_Payment', passing `@PRN`, `@TransDate`, and `@BankCode` as parameters.
- The underlying query executed is:

```
SET @PRN = '<value>'; SET @TransDate = '<value>'; SET @BankCode = '<value>'; INSERT INTO
`firs_newdb`.`firs_transaction` (payment_code, amount, bank_code, clearing_date,
client_id, created_at, description, notified_firs, payment_status, transaction_date,
transaction_ref, client_notify_count, firs_notify_count, payment_type, settled,
settlement_id, firs_response_code, is_new, notified_client) SELECT payment_code, amount,
@BankCode, @TransDate, 'Manual Payment', CURDATE(), description, 0, 1, @TransDate,
@PRN, 0, 0, 0, 0, "", "", 0, 0 FROM firs_newdb.`payment_request` WHERE payment_code =
@PRN; UPDATE firs_newdb.`payment_request` SET payment_status = 1, transaction_date =
@TransDate, transaction_ref = @TransRef WHERE payment_code = @PRN;
```

AC5 — Outcome Display

- System displays a clear success message of successful notification to NRS, if the stored procedure executes without error.

User Story 2 — Automation Transaction Verification

User Story: As a Tech Support Admin, I want to retrieve and review automation transactions by Month, Year and Bank, so that I can verify the transaction data before activating it for NRS push.

Pre-conditions / Pre-requisites

- User is authenticated and has Tech Support Admin role.
- User has navigated to the VAT Automation menu.
- System has read access to `firs_newdb.firs_auto_items`.
- Bank list is loaded from the `firs_bank` table.

Acceptance Criteria

AC1 — Search Form

- Search form provides three fields: Month (dropdown: Jan–Dec), Year (numeric input or dropdown), Bank (dropdown loaded from `firs_bank` table).
- All three fields are required before submission.
- A 'Get Automation Transactions' button submits the query.

AC2 — Query Execution

- On submission, the system executes the following query using the selected parameters:

```
SET @BankCode = '<value>'; SET @Month = <value>; SET @Year = <value>; SELECT invoice_no,
tax_amount, transaction_amount, created_at,      taxpro_ref, firs_response_message FROM
`firs_newdb`.`firs_auto_items` WHERE SUBSTRING(trans_ref, 1, 3) = @BankCode  AND
YEAR(transaction_date) = @Year  AND MONTH(transaction_date) = @Month;
```

AC3 — Results Table

- Results are displayed in a table with the following columns:
S/N, Bank Name, taxpro_ref, Invoice No, Tax amount, Transaction amount, Month, Year, Created Date/time, created By, NRS message, Pushed Status, Pushed By, Pushed date, With Revenue message
- The Result should display a card for Total Tax Amount, Total Transaction Volume, Total Transaction Value
- If no records are found, the system displays: "No records found for the selected parameters."

User Story 3 — Activate Automation Transaction Push to NRS

User Story: As a Tech Support Admin, I want to activate verified automation transactions for NRS push, so that eligible transactions are flagged and queued for the NRS notification pipeline.

Pre-conditions / Pre-requisites

- User Story 2 must be completed — transaction list must be displayed.
- User is authenticated and has Tech Support Admin role.
- System has write access to `firs_newdb.firs_auto_items`.
- The three required columns must exist on `firs_auto_items` before activation is possible:
`ready_for_nrs_push` VARCHAR(15) DEFAULT 'No' — values: 'No', 'Yes', 'Pushed'
`ready_for_nrs_pushBy` VARCHAR(85)
`ready_for_nrs_pushDate` DATETIME
- If columns do not exist, the DB migration must be applied first (see schema change below).

Acceptance Criteria

AC1 — Push Notification to NRS

- A 'Pushed To NRS' button is displayed above the transaction results table returned in User Story 2.

- Button is only enabled when a valid transaction list is displayed.

AC2 — Activation Execution

- Clicking 'Pushed To NRS' triggers the stored procedure `Activate_Automation_TransactionPush`, which sets `ready_for_nrs_push = 'Yes'` for all matching records.

- The underlying query executed is:

```
SET @NowUser = '<CurrentUser>'; UPDATE `firs_newdb`.`firs_auto_items` SET
ready_for_nrs_push = 'Yes', ready_for_nrs_pushBy = @NowUser, ready_for_nrs_pushDate =
CURDATE() WHERE SUBSTRING(trans_ref, 1, 3) = @BankCode AND YEAR(transaction_date) =
@Year AND MONTH(transaction_date) = @Month;
```

- @NowUser is populated automatically from the authenticated user's session.

AC3 — Required DB Schema Changes (Dev Action)

- The following ALTER TABLE statements must be executed before this feature is deployed:

```
ALTER TABLE `firs_newdb`.`firs_auto_items` ADD COLUMN ready_for_nrs_push VARCHAR(15)
DEFAULT 'No'; ALTER TABLE `firs_newdb`.`firs_auto_items` ADD COLUMN
ready_for_nrs_pushBy VARCHAR(85); ALTER TABLE `firs_newdb`.`firs_auto_items` ADD
COLUMN ready_for_nrs_pushDate DATETIME;
```

AC4 — Outcome Display

- On success, system displays: "Automation transactions successfully pushed to NRS."
- On failure, system displays a descriptive error message. No partial updates are applied.

User Story 4 — Notification Status Checker & Re-notification

User Story: As a Tech Support Admin, I want to view the notification status of payment gateway transactions and re-initiate notification for transactions not yet fully notified to NRS, so that no transaction is left unprocessed.

Pre-conditions / Pre-requisites

- User is authenticated and has Tech Support Admin role.
- User has navigated to VAT Notification Report within the VAT Automation menu.
- System has read/write access to `firs_newdb.firs_transaction`.

- Stored Procedures 'Get_PaymentGateway_Transactions' and 'Reset_For_Notification' are deployed and accessible.

AC1 — Default Report View

- On page load, the report table displays the top 20 most recent transactions fetched via the Stored Procedure 'Get_PaymentGateway_Transactions'.
- Table columns: S/N, payment_code (PRN), description, amount, client_id (Payment Channel), trnx_Date/Time, Trnx_Ref, NRS Resp Message, NRS Resp Code, Notification_Status, Notification Count, Trnx_Status, Created Date/time, Notification Date/Time, initiated By, Payment_Ref

AC2 — Filter Panel

- The report page includes a filter panel with the following fields: Date Range (From / To), PRN, Channel, Transaction Reference, Amount.
- An 'Apply' button submits the filter and retrieves matching records via Stored Procedure 'Get_PaymentGateway_Transactions' with the selected parameters.
- The underlying query used is:

```
SET @DateFrom = '<value>'; SET @DateTo = '<value>'; SELECT payment_code, description, amount, client_id AS PaymentChannel, transaction_date, transaction_ref, firs_response_code, firs_response_message FROM `firs_newdb`.`firs_transaction` WHERE transaction_date >= @DateFrom AND transaction_date <= @DateTo ORDER BY transaction_date DESC;
```

AC3 — Row Action: View Transaction

- Every row has a 'View Transaction' action button.
- Clicking it opens a detail view/modal showing the full transaction record for that row.

AC4 — Row Action: Initiate Notification

- The 'Initiate Notification' action button is enabled only on rows where the notification Status is "Pending", as determined by the Stored Procedure result.
- Clicking 'Initiate Notification' triggers Stored Procedure 'Reset_For_Notification', which resets the transaction to be eligible for NRS notification.
- The underlying reset query is:

```
SET @PRN = '<payment_code>'; UPDATE `firs_newdb`.`firs_transaction` SET notified_firs = 0, firs_notify_count = 0 WHERE payment_code = @PRN;
```

- On successful initiation, a pop-up message displays: "Transaction successfully notified to NRS."

- The row's Notification_Status updates to reflect the updated status.

3. User Story: View Client Secret

As Tech Support, I want to view a merchant's client secret to help troubleshoot integration issues while ensuring it remains secure.

Acceptance Criteria

- Tech Support can view, but not edit, the client secret.
- Attempts to modify the secret are blocked.

User Story: Resend Credentials

As Tech Support, I want to resend credentials to merchants who claim not to have received them, so that they can complete their integration.

Acceptance Criteria

- Resend button sends the credentials email to the merchant.
- All resend actions are logged for audit.

User Story: Edit User Permissions

As Tech Support, I want to edit user permissions related to Tech Support access so that I can quickly resolve access issues for my team without escalating.

Acceptance Criteria

- The Edit Permissions page is accessible to Tech Support users.
- Tech Support can:
 - Modify permissions only for Tech Support-related roles and capabilities.
 - Enable or disable access for Tech Support users.
- Tech Support cannot:
 - Create new users.
 - Assign DevOps, Admin, or Business roles.
 - Modify merchant integration privileges.
- All permission changes are recorded in the Audit Log.

4. Head of Tech Support

User Story: Create and Manage Tech Support Users

- As Head of Tech Support, I want to create and manage users so I can structure my support team's access.
 - **Acceptance Criteria**
- Head of Tech Support can create tech support users.
- Role must be assigned at creation (must be a tech support role).
- Head of Tech Support can activate/deactivate Tech Support users.

- All user creation/updates/deactivation actions are captured in the Audit Log (actor, action, timestamp, affected user).

User Story: Escalated PRN Operations

As Head of Tech Support, I want to validate PRNs and review VAT payment logs so I can handle high-level support issues.

Acceptance Criteria

- Head of Tech Support can perform PRN validation (same capability as Tech Support, but escalated authority).
- Head of Tech Support can view VAT payment execution logs/results (success/failure + timestamps).
- PRN operations performed by Head of Tech Support are captured in the Audit Log (actor, PRN, action, timestamp, outcome).

User Story: Oversee Permissions

As Head of Tech Support, I want to review and adjust system permissions so my team can work efficiently.

Acceptance Criteria

- Head of Tech Support can edit Tech Support-related roles/permissions.
- Head of Tech Support cannot edit:
 - DevOps permissions.
 - Merchant integration privileges (Access Point/System Integrator).
 - Credential regeneration actions.
- All permission changes are tracked in the Audit Log (actor, permission changed, affected user, timestamp).

5. Business Lead (Head of Business)

1. Create and Manage Business Users

User Story: As a business lead, I want to be able to create and manage business team members so I can structure my team's access.

Acceptance Criteria

- Role-based login is implemented, and users are assigned roles.
- Admin can create, edit, and deactivate user accounts.
- Users with view-only roles cannot modify data.
- Admin can set access levels (view-only, full access, analytics) for each user.
- User roles are properly enforced across the portal

2. Merchant Management Overview

User story: As a Business Lead, I want to be able to

- access and update merchant profiles, so that all relevant details (contact, activity status, industry type) are correct.

- tag merchants by industry or size, for easier filtering and reporting.

Acceptance Criteria:

- Business admin can access and edit all merchant profiles, including contact details (email, phone, address, contact person).
- Admin can group merchants by industry and size (small, medium, large).
- Admin can activate or deactivate merchant accounts.

Summary of Roles and Access Levels

Role	Responsibilities	Acceptance Criteria
Business Lead (Admin)	- Create/manage team members - Configure access levels - Oversee all portal functionalities - Customize reports, set up alerts. - View and analyse merchant data	Full access to all portal features and configurations, including user management and report customization.
Team Member	- View and analyse merchant data. - Monitor invoices, performance insights - Generate and export reports - View reports and dashboards - View merchant information	Access to analytics, invoice data, and reports (view/edit), with permissions defined by the Business Lead.

1. User Journeys and Flows

Phase 1: The Initial Hook (Super Admin)

- The DB/system auto-provisions the super admin.
- Super admin logs in via SSO/Active Directory.
- The super admin dashboard reveals the "User Management" module.

Phase 2: Admin Creation

On the User Management module on the dashboard, super admin clicks Create New User. A form open and super admin enters;

- Staff First Name and Last Name.
- Email address (System fetches user attributes from AD).
- Role (admin) permission should have been already be assigned.
- Then submit.
- System needs to

Phase 3: Team Member Creation

On the User Management module on the dashboard, admin clicks Create New User. A form open and super admin enters;

- Staff First Name and Last Name.
- Email address (System fetches user attributes from AD).
- Role (admin) permission should have been already be assigned.
- Then submit.
- System needs to

Notes

Assign Role: Super Admin selects "DevOps" from the Role dropdown.

Team Assignment: (N/A) For DevOps, the system skips the "Team" dropdown as they have cross-functional infrastructure access.

Activation: Access is granted immediately.

Phase 3: Provisioning Team Leads (The Hierarchy)

Search: Super Admin performs an AD Lookup for the intended Team Lead.

Assign Role: Selects "Team Lead".

Team Selection: Super Admin picks the specific department from the Teams Dropdown (e.g., NRS E-Invoicing, Tax Collection, Merchant Support, Dispute Resolution).

Save: Account is provisioned. The Team Lead now has "Managerial" permissions for that specific team.

Phase 4: Building the Team (Team Lead Access)

Login: Team Lead logs in. Their view is restricted to the Team Management tab.

Add Member: Team Lead searches for their team members via AD Lookup.

Fixed Mapping: The Teams Dropdown is automatically pre-filled and locked to the Team Lead's assigned department (e.g., if I am the "NRS Support Lead," I can only add people to "NRS Support").

Confirm: Member is added to the portal with specific "Operator" or "Viewer" permissions.

- Billa > IMS > e-invoicing service.
- Service pushes to our central DB, which will be displayed on the management portal.
- Merchant Information
Full access for Dev Ops
System sends a default password and user should be prompted to change password.
Role speaks to Departments
Create role and permission table – what can different the departments do?
